

## OVERVIEW

The SM5844AF is a digital audio signal, asynchronous sample rate converter LSI. It reads 16 or 20-bit word length input data, and writes 16, 18, or 20-bit word length output data. It also features a built-in digital deemphasis filter and digital attenuator.

The SM5844AF operates from a 5 V supply, and is available in 44-pin QFPs.

## FEATURES

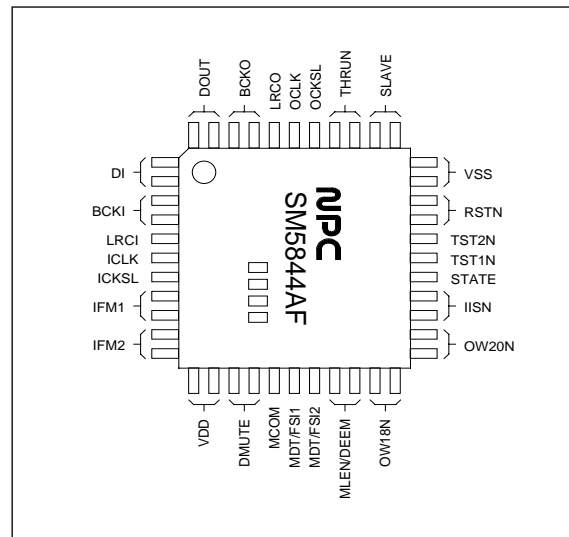

### Functions

- Left/right-channel processing (stereo)
- Input sample rate (fsi) ranges
  - 24 to 48 kHz (256fsi mode)
  - 27 to 55 kHz (384fsi mode)
- Output sample rate (fso) range
  - 20 to 100 kHz
- Sample rate conversion ratio (fso/fsi)
  - 0.5 to 2.0 times
- Asynchronous input and output timing (clock inputs)
- System clock inputs (input and output clocks independent)
  - 256fsi or 384fsi input system clock
  - 256fso or 384fso output system clock
- Deemphasis filter
  - IIR-type filter
  - 44.1, 48 or 32 kHz
- Digital attenuator
  - 11-bit data for 1025 levels
  - Smooth, incremental attenuation change
  - +12 dB gain shift function
- Direct mute function
- Through mode operation
  - Input to output direct
- Output data clocks (LRCK, BCKO)
  - External input (slave mode)
  - Output system clock generated internally (master mode)
- CMOS-level input/outputs
- 5 V (standard) single supply
- 44-pin QFP
- Molybdenum-gate CMOS process

## APPLICATIONS

- Digital audio equipment, sample rate conversion (audiovisual amplifiers, CD-R, DAT, MD and 8 mm VTRs)
- Commercial recording/editing equipment, sample rate conversion
- Input data jitter elimination

## PINOUT

## PACKAGE DIMENSIONS

Unit: mm

### 44-pin QFP

## Filter Characteristics and Converter Efficiency

- 20-bit internal data word length
- Deemphasis filter characteristics (IIR filter)
  - $\pm 0.03$  dB gain deviation from ideal filter characteristics
- Converter noise levels
  - $\leq -110$  dB internally-generated noise
  - $-98$  dB (16-bit output),  $-110$  dB (18-bit output) and  $-122$  dB (20-bit output) word rounding noise
- Anti-aliasing LPF characteristics (4 FIR filters) with automatic output/input sample rate conversion ratio selection
  - Up converter LPF (1.0 to 2.0 times)
  - Down converter LPF 1 (48.0 to 44.1 kHz or 0.92 times)
  - Down converter LPF 2 (44.1 to 32.0 kHz or 0.73 times)
  - Down converter LPF 3 (48.0 to 32.0 kHz or 0.67 times)
- Output S/N ratio (theoretical values)

Output signal word length	S/N ratio	
	16-bit input word length	20-bit input word length
16 bits	94.8 dB	97 dB
18 bits	97.5 dB	106 dB
20 bits	97.7 dB	109 dB

## Interfaces

- Input data format
  - 2s-complement, L/R alternating, serial
  - Normal format (non IIS)

Mode	Word length	Front/rear packing	Data sequence
1	16 bits	Rear	MSB first
2	20 bits		
3		Front	
4		Rear	LSB first

- Output data format
  - 2s-complement, MSB first, L/R alternating, serial
  - Continuous bit clock

Mode	Word length	IIS selection	Front/rear packing
1	16 bits	Normal (non IIS)	Rear
2	18 bits		
3	20 bits		
4	20 bits		
5	16 bits	IIS	Front
6	18 bits		
7	20 bits		

**BLOCK DIAGRAM**

## PIN DESCRIPTION

Number <sup>1</sup>	Name	I/O <sup>2</sup>	Description				
1, 2	DI	Ip	Data input				
3, 4	BCKI	Ip	Input bit clock				
5	LRCI <sup>3</sup>	Ip	Input word clock (fsi)				
6	ICLK	I	Input system clock input				
7	ICKSL	Ip	Input system clock (ICLK) select. 384fsi when HIGH, and 256fsi when LOW.				
8, 9	IFM1	Ip	Input format select				
10, 11	IFM2	Ip	IFM1	IFM2	Word length	Data sequence	Data position
			LOW	LOW	16 bits	MSB first	Rear packed
			LOW	HIGH	20 bits		Front packed
HIGH	LOW	LSB first	Rear packed				
12, 13	VDD	-	5 V supply pin				
14, 15	DMUTE	Ip	Direct mute pin				
16	MCOM	Ip	Interface switch control pin. MDT, MCK and MLEN control when HIGH. FSI1, FSI2 and DEEM control when LOW.				
17	MDT/FSI1	Ip	When MCOM is HIGH: Microcontroller interface data input (MDT)	When MCOM is LOW: Deemphasis frequency set pins			
18	MCK/FSI2	Ip	When MCOM is HIGH: Microcontroller interface bit clock (MCK)	FSI1	FSI2	fsi	
				LOW	HIGH	48.0 kHz	
				×	LOW	44.1 kHz	
				HIGH	HIGH	32.0 kHz	
19, 20	MLEN/DEEM	Ip	When MCOM is HIGH: Microcontroller data word latch clock (MLEN) When MCOM is LOW: Deemphasis ON/OFF control (DEEM)				
21, 22	OW18N	Ip	Output format select When IISN = HIGH (normal mode)				
			OW20N	OW18N	Word length	Data position	
			LOW	LOW	20 bits	Front packed	
			LOW	HIGH		Rear packed	
HIGH	LOW	18 bits					
HIGH	HIGH	16 bits					
23, 24	OW20N	Ip	When IISN = LOW (IIS mode)				
			OW20N	OW18N	Word length	Data position	
			LOW	LOW	20 bits	IIS mode Front packed	
			LOW	HIGH			
HIGH	LOW	18 bits					
HIGH	HIGH	16 bits					
25, 26	IISN	Ip	IIS output mode select. Normal mode when HIGH, and IIS mode when LOW.				
27	STATE	O	Internal operation status output (for operation check)				
28	TST1N	Ip	Output dither control. Dither ON when LOW, and OFF when HIGH.				
29	TST2N	Ip	Test pin. Test mode when LOW. Normal operating mode when HIGH.				

## SM5844AF

Number <sup>1</sup>	Name	I/O <sup>2</sup>	Description
30, 31	RSTN	lp	Reset pin
32, 33	VSS	-	0 V ground pin
34, 35	SLAVE	lp	BCKO and LRCO mode set. Outputs (master mode) when LOW, and inputs (slave mode) when HIGH.
36, 37	THRUN	lp	DOUT through mode set. Normal mode when HIGH, and through mode when LOW.
38	OCKSL	lp	Output system clock (OCLK) select. 384fso when HIGH, and 256fso when LOW.
39	OCLK	I	Output system clock input
40	LRCO <sup>3</sup>	I/O	Output word clock input/output (fso). Input/output mode set by the level on SLAVE.
41, 42	BCKO	I/O	Output bit clock input/output. Input/output mode set by the level on SLAVE.
43, 44	DOUT	O	Data output

1. Pins which have the same name are connected internally. Accordingly, circuit connections can be made to either pin or to both pins.

2. I = input, lp = Input with pull-up resistor (HIGH-level pins can be left open), O = output, I/O = input/output

3. fsi is the input word clock (LRCl) frequency, and fso is the output word clock (LRCO) frequency.

## SPECIFICATIONS

### Absolute Maximum Ratings

$$V_{SS} = 0 \text{ V}$$

Parameter	Symbol	Rating	Unit
Supply voltage range	$V_{DD}$	-0.3 to 7.0	V
Input voltage range	$V_{IN}$	-0.3 to $V_{DD} + 0.3$	V
Storage temperature range	$T_{stg}$	-40 to 125	°C
Power dissipation	$P_D$	550	mW
Soldering temperature	$T_{sld}$	255	°C
Soldering time	$t_{sld}$	10	s

### Recommended Operating Conditions

$$V_{SS} = 0 \text{ V}$$

Parameter	Symbol	Rating	Unit
Supply voltage range	$V_{DD}$	4.75 to 5.5	V
Operating temperature range	$T_{opr}$	-20 to 70	°C

### DC Electrical Characteristics

$V_{DD} = 4.75$  to  $5.5$  V,  $V_{SS} = 0$  V,  $T_a = -20$  to  $70$  °C

Parameter	Symbol	Condition	Rating			Unit
			min	typ	max	
Current consumption	$I_{DD}$	$V_{DD} = 5.0$ V <sup>1</sup>	-	-	80	mA
HIGH-level input voltage <sup>2,3</sup>	$V_{IH}$		$0.7V_{DD}$	-	-	V
LOW-level input voltage <sup>2,3</sup>	$V_{IL}$		-	-	$0.3V_{DD}$	V
AC-coupled input voltage <sup>2</sup>	$V_{ACI}$		$0.3V_{DD}$	-	-	$V_{p-p}$
HIGH-level output voltage <sup>4</sup>	$V_{OH}$	$I_{OH} = -1.0$ mA	$V_{DD} - 0.5$	-	-	V
LOW-level output voltage <sup>4</sup>	$V_{OL}$	$I_{OL} = 1.0$ mA	-	-	0.4	V
HIGH-level input current <sup>2</sup>	$I_{IH}$	$V_{IN} = V_{DD}$	-	10	20	$\mu$ A
LOW-level input current <sup>2,3</sup>	$I_{IL}$	$V_{IN} = 0$ V	-	10	20	$\mu$ A
Input leakage current <sup>3</sup>	$I_{LH}$	$V_{IN} = V_{DD}$	-	-	1.0	$\mu$ A
Pull-up resistance <sup>3</sup>	$R_{IH}$		250	500	1000	k $\Omega$

1. ICKSL = LOW, OCKSL = LOW,  $f_{ICKLK} = 13.0$  MHz,  $f_{OCKLK} = 13.0$  MHz, no output load

2. Pins ICLK and OCLK.

3. Pins DI, BCKI, LRCI, ICKSL, IFM1, IFM2, DMUTE, MCOM, MDT/FS1, MCK/FS12, MLEN/DEEM, OW18N, OW20N, IISN, TST1N, TST2N, RSTN, THRUN, OCKSL and SLAVE.

4. Pins DOUT, BCKO, LRCO and STATE.

### AC Electrical Characteristics

$V_{DD} = 4.75$  to  $5.5$  V,  $V_{SS} = 0$  V,  $T_a = -20$  to  $70$  °C

#### ICLK input

Parameter	Symbol	Condition		Rating			Unit
		ICKSL	System clock	min	typ	max

## Filter Characteristics

### Anti-aliasing filter frequency characteristic

### Deemphasis filter frequency characteristic

## FUNCTIONAL DESCRIPTION

### Input Data Interface (DI, LRCI, BCKI, IFM1, IFM2)

Mode	IFM1	IFM2	Word length	Data position	Data sequence	Common features
1	LOW	LOW	16 bits	Rear packed	MSB first	Non IIS L/R alternating Bit serial
2	LOW	HIGH	20 bits			
3	HIGH	LOW		Front packed		
4	HIGH	HIGH		Rear packed	LSB first	

### Attenuator and Deemphasis Selection

The attenuator is set using the microcontroller interface. When the attenuator is used, deemphasis settings also need to be set using the microcontroller interface. The microcontroller interface comprises MDT, MCK and MLEN, and is used to receive all input serial data.

Table 1. Attenuator and deemphasis function selection

Function	Function set method	
	External pins (MCOM = LOW)	Microcontroller interface flags (MCOM = HIGH)
Deemphasis ON/OFF	DEEM	FDEEM
Deemphasis frequency (fsi) select	FSI1, FSI2	FFSI1, FFSI2
Attenuator data set	N/A (no attenuation)	11 bits (a1 to a11)
Test mode select	Irreversible (test mode 1)	FTST1, FTST2

When MCOM is HIGH, serial data received on MDT, MCK and MLEN sets the attenuation data and control flag data.

When MCOM is LOW, the logic levels on FSI1, FSI2 and DEEM select the device function.

### Microcontroller Interface (MCOM, MDT, MCK, MLEN)

When MCOM is HIGH, MDT (data), MCK (clock) and MLEN (latch enable clock) interface pins are used.

Input data on MDT is synchronized to the MCK clock. Data is read into the input stage shift register on the rising edge of MCK. Accordingly, the input data should change on the falling edge of MCK. Input data enters an internal SIPO (serial-to-parallel converter register), and then the parallel data is

latched into the mode register on the rising edge of the latch enable clock MLEN.

The mode register addressed is determined by the 1st bit of the 12 data bits before MLEN goes HIGH. If this bit is LOW, then the data is read into the attenuation data register as shown in figure 1. If this bit is HIGH, then the data is read into the mode flag register as shown in figure 2. The function of each bit in the mode flag register is described in table 1.

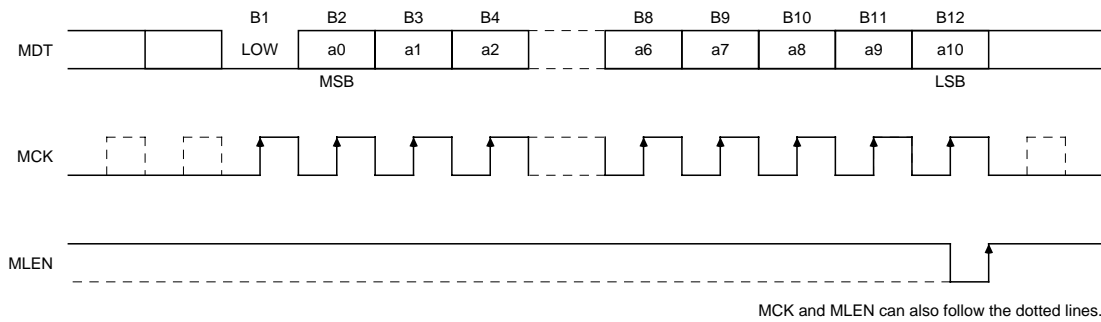

Figure 1. Attenuation data format (B1 = LOW)

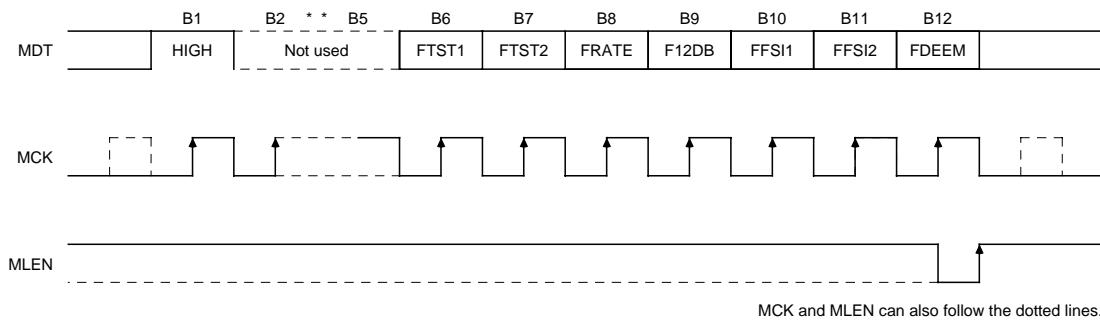

Figure 2. Mode flag data format (B1 = HIGH)

Table 2. Mode flag description

B1	Bit	Mode flag	Mode function select			Reset mode															
			Parameter	LOW/HIGH	Select

B11	FFSI2	Deemphasis filter fs select 2			LOW																
B12	FDEEM	Deemphasis control ON/OFF	LOW	Deemphasis filter OFF	LOW																
			HIGH	Deemphasis filter ON																	

**Deemphasis (DEEM, FSI1, FSI2 pins or FDEEM, FFSI1, FFSI2 flags)**

The digital deemphasis filter is an IIR filter with variable coefficients to faithfully reproduce the gain and phase characteristics of standard analog deemphasis filters.

The filter coefficients are selected by FSI1 (or FFSI1 flag) and FSI2 (or FFSI2 flag) to correspond to the sampling frequencies fs = 44.1, 48.0 and 32.0 kHz.

Table 3. Deemphasis ON/OFF

When MCOM = LOW	When MCOM = HIGH	Deemphasis
DEEM = HIGH	FDEEM = HIGH	ON
DEEM = LOW	FDEEM = LOW	OFF

Table 4. Deemphasis fs select (FSI1, FSI2 pins or FFSI1, FFSI2 flags)

MCOM = LOW (MCOM = HIGH)		fs
FSI1 (FFSI1)	FSI2 (FFSI2)	
LOW	LOW	44.1 kHz
HIGH	LOW	
LOW	HIGH	48.0 kHz
HIGH	HIGH	32.0 kHz

### Attenuation (MDT, MCK, MLEN)

The digital attenuator coefficients are read in as serial data on the microcontroller interface. Data on MDT is read into the internal shift register on the rising edge of MCK, and then 12 bits are latched internally on the rising edge of MLEN.

When the leading bit is 0 (B1 = LOW), the following 11 bits are read into the attenuation register and used as an unsigned integer in MSB first format. See figure 3.

Figure 3. Attenuation data format (microcontroller interface)

Although the attenuation data comprises 11 bits, only 1025 levels are valid as given by the following.

$$DATT = \sum_{i=0}^{10} a_i \times 2^{(10-i)}$$

The gain of the attenuator for values of DATT from 001H to 400H are given by the following equations. Note that when the F12DB flag is HIGH, the gain is shifted by +12.0412 dB.

$$\text{Gain} = 20 \times \log\left(\frac{DATT}{1024}\right) [\text{dB}]$$

when F12DB = LOW

$$= 20 \times \log\left(\frac{DATT}{256}\right) [\text{dB}]$$

when F12DB = HIGH

After a system reset initialization, DATT is set to 400H and the F12DB flag is LOW, corresponding to 0 dB gain. (The F12DB flag is described in table 2.)

Table 5. Attenuator settings

Attenuation data DATT	F12DB = LOW (default)		F12DB = HIGH	
	Gain (dB)	Linear expression	Gain (dB)	Linear expression
000H	$-\infty$	0.0	$-\infty$	0.0
001H	-60.206	1/1024	-48.165	1/256
↓	↓	↓	↓	↓
100H	-12.041	256/1024	0.0	256/256
↓	↓	↓	↓	↓
3FFH	-0.0085	1023/1024	12.032	1023/256
400H (to 7FFH)	0	1.0	12.041	4.0

### Attenuator operation

A change in the attenuation data DATT causes the gain to change smoothly from its previous value towards the new setting. The new attenuation data is stored in the attenuation data register and the current attenuation level is stored in a temporary register. Consequently, if a new attenuation level is read in before the previously set level is reached, the gain changes smoothly from the current value towards the latest setting as shown in figure 4.

The attenuation counter output changes, and hence the gain changes, by 1 step every output sample. The time taken to reduce the gain from 0 dB (or 12 dB) to  $-\infty$  dB is  $(1024/f_{so})$ , which corresponds to approximately 23.2 ms when  $f_{so} = 44.1$  kHz.

Figure 4. Attenuator operation example

**Direct Mute (DMUTE)****Direct mute ON/OFF**

Table 6. DMUTE operation

DMUTE	Function
LOW	Normal data is output from the next output word (mute OFF)
HIGH	0 data is output from the next output word (mute ON)

**Reset mute**

Table 7. RSTN mute operation

RSTN	Function
LOW	0 data is output from the next output word (mute ON)
HIGH	Normal data is output from the 3073rd output word (mute OFF)

**Internal operating status (STATE)**

Internally, all functions are performed using 20-bit serial data, and the conversion rate and filter type are

automatically selected for output. Output data is in 20-bit front-packed format.

Table 8. Bit function

Output bit position	Content				
1st to 18th	(Output data cycle/input data cycle) – 9 Ex. 1st                                      18th 00.1111111111110111 ⇒ 1.0 times 01.1111111111110111 ⇒ 2.0 times (1/2 conversion rate ratio) 00.0111111111110111 ⇒ 0.5 times (2.0 conversion rate ratio)				
19th	DA1	Selected filter type			
20th	DA0	DA1	DA0	Filter	Mode
		0	0	Up converter	1
		1	0	44.1 to 48 kHz	2
		0	1	32 to 44.1 kHz	3
		1	1	32 to 48 kHz	4

Note that when THRUN is LOW, LRCO and BCKO are not guaranteed to be synchronized to the STATE output.

## System Clock

### Input system clock (ICLK, ICKSL)

The input system clock can be set to run at either 256fsi or 384fsi, where fsi is the input frequency on LRCI.

Note that ICLK and LRCI should be divided from a common clock source or PLL to maintain synchronism.

Table 9. ICLK system clock

ICKSL	ICLK system clock rate
HIGH	384fsi
LOW	256fsi

### Output system clock (OCLK, OCKSL)

The output system clock can be set to run at either 256fso or 384fso, where fso is the input frequency on LRCO. In through mode, OCLK and OCKSL have no function and are not used.

Note that in slave mode, a suitable clock must be input on OCLK. The clock on OCLK should ideally have a protection circuit to prevent incorrect operation for times when the clock on ICLK is halted.

Table 10. OCLK system clock

SLAVE	OCKSL	OCLK system clock rate
LOW	HIGH	384fso
	LOW	256fso
HIGH	×	Not used

## Output data interface and output clock selection (LRCO, BCKO, DOUT, SLAVE)

Table 11. Output mode description

THRUN	SLAVE	Function		
		Mode	Description	LRCO, BCKO state
HIGH	LOW	Master mode	Output word clock (LRCO) and output bit clock (BCKO) are divided from OCLK.	Outputs
	HIGH	Slave mode	Output word clock (LRCO) and output bit clock (BCKO) are supplied externally.	Inputs <sup>1</sup>
LOW	×	Through mode	Output word clock (LRCO), output bit clock (BCKO) and output data (DOUT) are the same as LRCI, BCKI and DI, respectively.	Outputs

1. The number of BCKO input clock cycles should not exceed 64 per word. Correct operation is not guaranteed beyond these limits.

## System Reset (RSTN)

At power-ON, all device functions must be reset. The device is reset by applying a LOW-level pulse on RSTN. At system reset, the internal arithmetic operation, output timing counter and internal flag register operation are synchronized on the next LRCI rising edge. Note that all flags are set to their defaults (all LOW).

A power-ON reset signal can be applied from an external microcontroller. For systems where ICLK and LRCI are stable at power ON, initialization can be performed by connecting a 0.001  $\mu$ F capacitor between RSTN and VSS. Otherwise, a capacitor value should be chosen such that RSTN does not go HIGH until after LRCI and ICLK have stabilized.

## Through Mode (THRUN)

Table 12. THRUN operation

THRUN	Mode	Description
LOW	Through mode	Direct connections are made: LRCI to LRCO, BCKI to BCKO, and DI to DOUT.
HIGH	Normal mode	Sample rate converter operation

## Internal Arithmetic Timing Auto-reset

The clock on LRCI should pass through 1 cycle for every 384 (ICKSL = HIGH) or 256 (ICKSL = LOW) ICLK clock cycles to maintain correct internal arithmetic sequence. If the number of ICLK cycles is different, increases or decreases, or any jitter is present, device operation could be affected.

There is a fixed-value tolerance within which the internal sequence and LRCI clock timing are not adversely affected.

Table 13. Clock tolerance

ICKSL	Allowable clock variation
HIGH (384fs mode)	+8/-6 cycles
LOW (256fs mode)	+4/-3 cycles

Whenever the allowable tolerance is exceeded, the internal sequence is automatically reset so that the internal sequence matches the LRCI clock. When this occurs, there is a possibility that click noise will be generated.

## Output Format Control (OW18N, OW20N, IISN)

The output is in MSB-first, 2s-complement, L/R alternating, bit serial format with a continuous bit clock.

Table 14. Output format selection

Mode	Inputs			Output format		
	IISN	OW20N	OW18N	Word length	IIS selection	Front/rear packing
1	HIGH	HIGH	HIGH	16 bits	Non IIS	Rear
2		HIGH	LOW	18 bits		
3		LOW	HIGH	20 bits		
4		LOW	LOW	20 bits		
5	LOW	HIGH	HIGH	16 bits	IIS	Front
6		HIGH	LOW	18 bits		
7		LOW	×	20 bits		

## Output Timing Calculation

The output timing is calculated to maintain the desired ratio between the output data cycle and the input data cycle.

## Filter Characteristic Selection

Conversion rates from 0.5 to 2.0 times are supported using the following 4 filter types.

The ratio between the output sample rate and input sample rate is measured automatically and the most suitable filter type for this ratio is selected automatically.

Table 15. fs ratio and filter selection

Mode	Filter	fs ratio (fso/fsi)	Selects range
1	Up converter	1.0 to 2.0	≥ 0.97
2	48.0 to 44.1 kHz	0.91875	0.865 to 0.97
3	44.1 to 32.0 kHz	0.72562	0.711 to 0.865
4	48.0 to 32.0 kHz	0.66667	≤ 0.711

When the selected fs conversion ratio and the actual sample rate conversion ratio do not coincide, the following phenomenon are generated.

Table 16. fs ratio mismatch

Condition	Affect
Actual sample rate conversion ratio is lower than the selected filter conversion ratio	The audio band high-pass develops aliasing noise.
Actual sample rate conversion ratio is higher than the selected filter conversion ratio	The audio band high-pass is cut off.

Note: An output noise may be generated if the fs conversion ratio changes at a rate greater than 0.057%/sec.

## TIMING DIAGRAMS

### Input Timing Examples (DI, BCKI, LRCI)

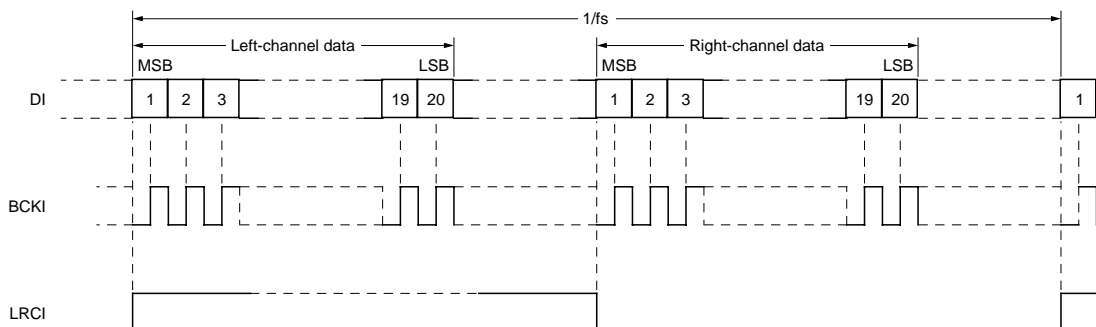

#### Audio data input timing (rear-packed 16-bit word, IFM1 = LOW, IFM2 = LOW)

#### Audio data input timing (rear-packed 20-bit word, IFM1 = LOW, IFM2 = HIGH)

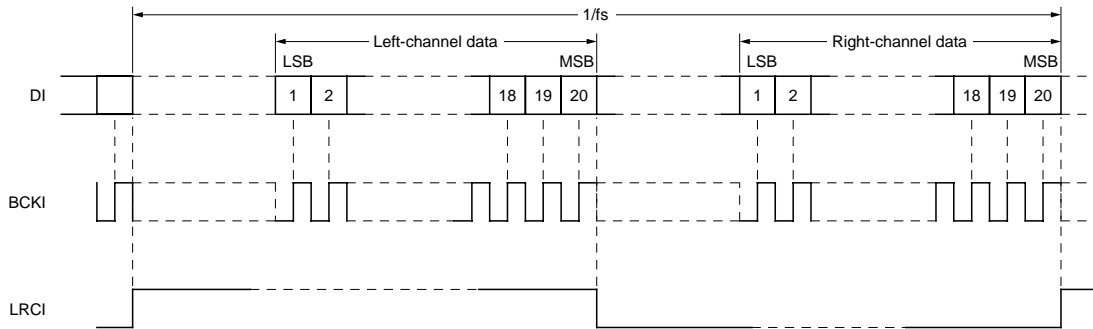

#### Audio data input timing (front-packed 20-bit word, IFM1 = HIGH, IFM2 = LOW)

All data bits after the LSB (20th bit) are ignored. Accordingly, more than 20 BCKI cycles are required.

**Audio data input timing (rear-packed 20-bit word, LSB first, IFM1 = HIGH, IFM2 = HIGH)**

**Output Timing Examples (DOUT, BCKO, LRCO)**

**Audio data output timing (rear-packed 16-bit word)**

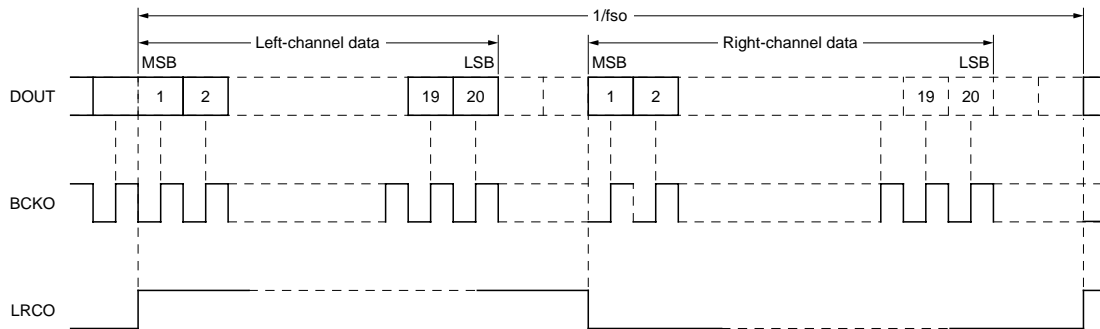

**Audio data output timing (rear-packed 18-bit word)**

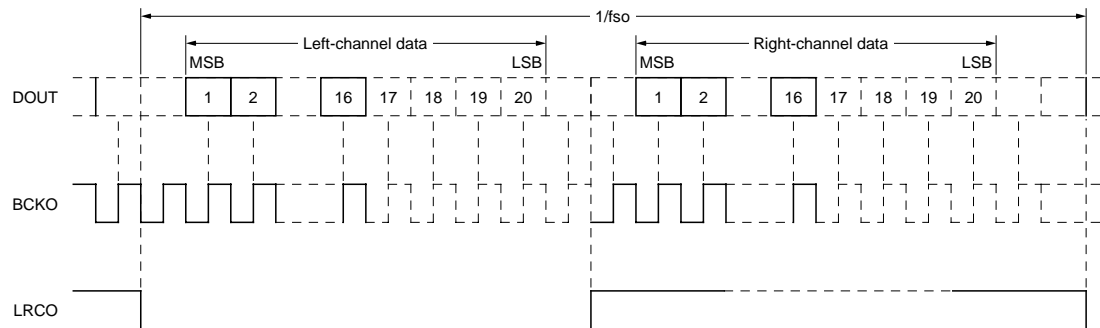

**Audio data output timing (rear-packed 20-bit word)**

**Audio data output timing (front-packed 20-bit word, OW18N = LOW, OW20N = LOW)**

**Audio data output timing (IIS mode, front-packed 16/18/20-bit word selected by OW18N and OW20N)**

Data is output in 20-bit units.

**State Data Output Timing**

**State data output timing (IISN = HIGH)**

**State data output timing (IISN = LOW)**

## Delay Time

$t_{\text{INPUT}}$  is the time when the serial input data has been read in completely (on the rising edge of LRCI).  
 $t_{\text{OUTPUT}}$  is the time when the serial output data has

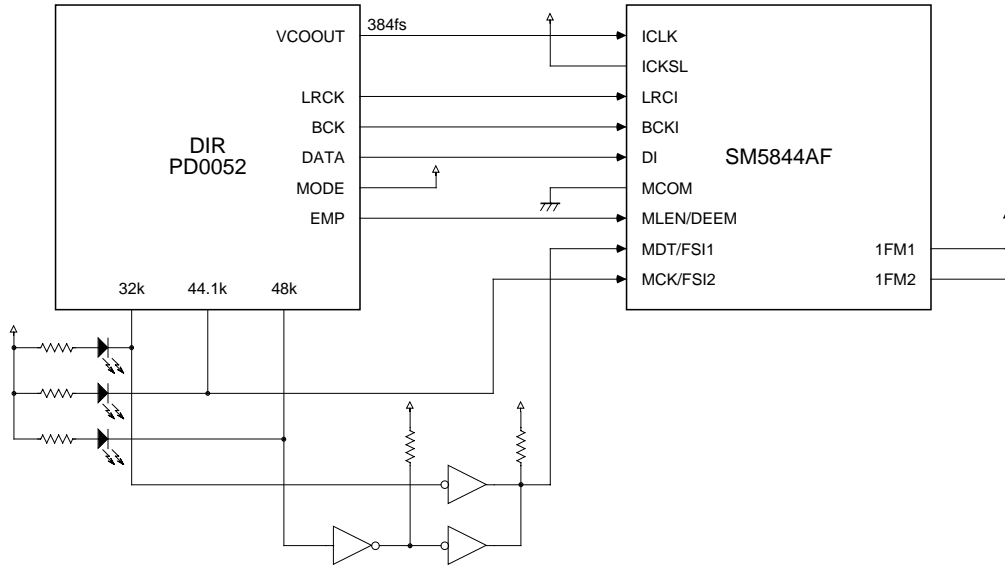

been read out completely (on the rising edge of LRCO). The delay between input and output is given by  $t_{\text{OUTPUT}} - t_{\text{INPUT}} = (49 \pm 2)/f_{\text{SI}}$ .

## TYPICAL APPLICATIONS

### Input Interface Circuits

#### Digital audio interface receiver (PD0052)

#### Digital audio interface transceiver (YM3613)

**APPLICATION NOTE**

**Delay in the slave mode**

In the slave mode, the delay (tbdH2, tbdL2) of DUOT from BCKO is MIN= 10ns, MAX= 100ns which is rather wide width.

As specified in AC Electrical Characteristics, and BCKO is prohibited from inputting longer than 64fso.

When tbdH2, tbdL2 is maximum 100ns, ideal timing may not be attained for the following device, depending on the OCLK cycle (example 1).

Please use considering the timing in the following examples in the slave mode.

(example 1) OCLK= 39ns(fs= 99.84kHz), OCKSL= L(256fs), BCKO(64fso)= 156ns, OW20N= L, OW18N= H

(example 2) OCLK= 59ns(fs= 44.1kHz), OCKSL= H(384fs), BCKO(64fso)= 354ns, OW20N= L, OW18N= H

NIPPON PRECISION CIRCUITS INC. reserves the right to make changes to the products described in this data sheet in order to improve the design or performance and to supply the best possible products. Nippon Precision Circuits Inc. assumes no responsibility for the use of any circuits shown in this data sheet, conveys no license under any patent or other rights, and makes no claim that the circuits are free from patent infringement. Applications for any devices shown in this data sheet are for illustration only and Nippon Precision Circuits Inc. makes no claim or warranty that such applications will be suitable for the use specified without further testing or modification. The products described in this data sheet are not intended to use for the apparatus which influence human lives due to the failure or malfunction of the products. Customers are requested to comply with applicable laws and regulations in effect now and hereinafter, including compliance with export controls on the distribution or dissemination of the products. Customers shall not export, directly or indirectly, any products without first obtaining required licenses and approvals from appropriate government agencies.
