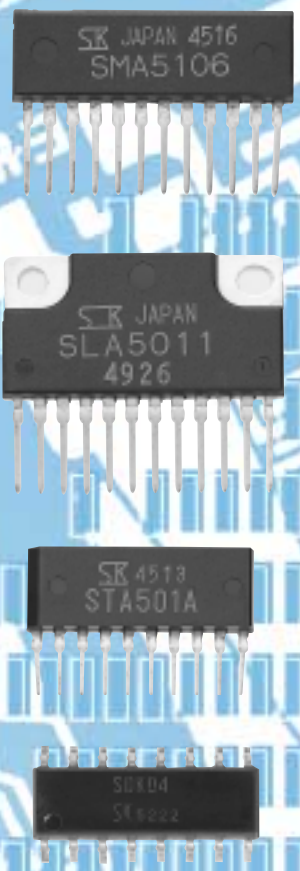
POWER TRANSISTOR ARRAYS
&
MOS FET ARRAYS



SANKEN ELECTRIC CO.,LTD.

⚠ CAUTION / WARNING

- The information in this publication has been carefully checked and is believed to be accurate; however, no responsibility is assumed for inaccuracies.
- Sanken reserves the right to make changes without further notice to any products herein in the interest of improvements in the performance, reliability, or manufacturability of its products. Before placing an order, Sanken advises its customers to obtain the latest version of the relevant information to verify that the information being relied upon is current.
- Application and operation examples described in this catalog are quoted for the sole purpose of reference for the use of the products herein and Sanken can assume no responsibility for any infringement of industrial property rights, intellectual property rights or any other rights of Sanken or any third party which may result from its use.
- When using the products herein, the applicability and suitability of such products for the intended purpose or object shall be reviewed at the users' responsibility.
- Although Sanken undertakes to enhance the quality and reliability of its products, the occurrence of failure and defect of semiconductor products at a certain rate is inevitable. Users of Sanken products are requested to take, at their own risk, preventative measures including safety design of the equipment or systems against any possible injury, death, fires or damages to the society due to device failure or malfunction.
- Sanken products listed in this catalog are designed and intended for the use as components in general purpose electronic equipment or apparatus (home appliances, office equipment, telecommunication equipment, measuring equipment, etc.). Before placing an order, the user's written consent to the specifications is requested.
  When considering the use of Sanken products in the applications where higher reliability is required (transportation equipment and its control systems, traffic signal control systems or equipment, fire/crime alarm systems, various safety devices, etc.), please contact your nearest Sanken sales representative to discuss and obtain written confirmation of your specifications.
  The use of Sanken products without the written consent of Sanken in the applications where extremely high reliability is required (aerospace equipment, nuclear power control systems, life support systems, etc.) is strictly prohibited.
- Anti radioactive ray design is not considered for the products listed herein.
- This publication shall not be reproduced in whole or in part without prior written approval from Sanken.

Ordering

Specify the number of standard minimum packaged units when placing an order.

Standard minimum packaged unit

Package Type / Series	Cardboard Box	Stick	Reel
SLA	50	108	
SMA	120	108	
STA300	100		
STA400	80		
STA500		110	
SDK			1200

Storage, characteristic inspection, and handling precautions

Inappropriate storage, characteristic inspection, or handling may impair the reliability of the device. To ensure high reliability, observe the following precautions:

1. Storage precautions

- It is recommended to store the device at room temperature (between 5 and 35°C) and relative humidity of 40 to 75%. Avoid storing the device in a place where the temperature or humidity is high or changes greatly.
- Store the device in a clean place that is not exposed to direct sunlight, and is free from corrosive or harmful gases.
- If the device is stored for a long time, check the solderability and lead condition before using the device.

2. Precautions on characteristic inspections

When carrying out characteristic inspections on receiving products or other occasions, take care to avoid applying a surge voltage from the measuring equipment and check the terminals of the measuring equipment for a short circuit or wiring errors. Measure the device within the range of its rated values.

3. Silicone Grease

When attaching a heatsink, apply a small amount of silicone evenly to the back of the device and both sides of the insulator to reduce the thermal resistance between the device and heatsink.

Recommended silicone grease

●G746	**SHINETSU SILICONE CO., LTD.**
●YG6260	**GE TOSHIBA SILICONE CO., LTD.**
●SC102	**DOW CORNING TORAY SILICONE CO., LTD.**

Please select a silicone grease carefully since the oil in some grease can penetrate the product, which will result in an extremely short product life.

4. Screw tightening torque

If screws are not tightened with sufficient torque, this can increase the thermal resistance and reduce the radiation effect. Tightening screws with too great a torque damage the screw thread, deform the heatsink, or twist the device frame until it is damaged. Therefore, tighten screws with a torque between 0.588 and 0.784 N • m (6 to 8 kgf • cm).

5. Soldering temperature

If soldering is necessary, take care to keep the application of heat as brief as possible, and within the following limits:

260±5°C for 10 s max

350°C for 3 s max (soldering iron)

6. Heatsink

A large contact area between the device and the heatsink for effective heat radiation is required. To ensure a large contact area, minimize mounting holes and select a heatsink with a sufficiently smooth surface and that is free from burring or metal debris.

7. Handling precautions to protect power MOSFET arrays from static damage

- When handling the device, physical grounding is necessary. Wear a wrist strap with a 1 MΩ resistor close to the body in the wrist strap to prevent electric shock.
- Use a conductive tablemat or floor mat at the device handling workbench and to ensure grounding.
- When using a curve tracer or other measuring equipment, ground the equipment as well.
- When soldering, ground the bit of the soldering iron and the dip tank to prevent a leakage voltage from damaging the device.
- Store the device in the shipping container or a conductive container or use aluminum foil to protect the device from static electricity.

Avalanche energy capability of MOSFET array

Sanken MOSFETs feature guaranteed avalanche energy capability.

1. What is avalanche energy capability ?

When a MOSFET is used for high-speed switching, the inductive load and wiring inductance may cause a counter electromotive voltage at cutoff that the device cannot withstand.

Avalanche energy capability is the non-clamped ability to withstand damage expressed as energy. As long as the energy applied to the device at cutoff is within the guaranteed avalanche energy capability, the device will not be damaged even if the drain-source voltage exceeds the capability.

For example, a drain-source voltage that is within the guaranteed capability when electrically stationary may exceed the limit at startup or cutoff. Usually, a snubber circuit or similar surge absorbing circuit is used to keep the drain-source voltage within the guaranteed capability. Sanken MOSFETs, however, do not require this kind of protective circuit because the avalanche energy capability is guaranteed. Sanken MOSFETs enable the number of parts to be reduced, saving board area.

* Consult the engineering department of Sanken when planning to use MOSFETs in avalanche mode.

2. EAS calculation method

If the current in an inductive load L is I_{LP} at the moment when the MOSFET is cut off, E_{AS} can be expressed as follows:

$$E_{AS} = \frac{1}{2} \cdot L \cdot I_{LP}^2 \cdot \frac{V_{DSS}}{V_{DSS} - V_{DD}} \quad \cdots\cdots ①$$

*V_{DD} : Supply voltage

If the value of L is not known in an actual circuit, EAS can also be calculated from the actual voltage and current waveforms as follows:

$$E_{AS} = P_S \cdot t \quad \cdots\cdots ②$$

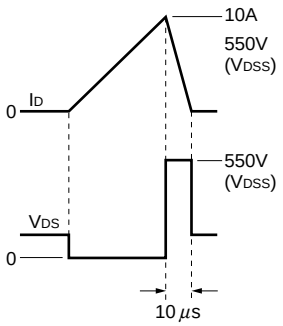
*P_S : Surge power *t : Surge time

The following calculation is used to determine E_{AS} where the voltage and current shown in Fig. A are applied to the MOSFET in a circuit

Integrate the overlapping section of I_D and V_{DS} to calculate $\int I_D \cdot V_{DS} \cdot dt$. When the I_D waveform is triangular, E_{AS} will be as follows:

$$E_{AS} = \frac{1}{2} \cdot 10(A) \cdot 550(V) \cdot 10(\mu s) = 27.5(mJ)$$

Fig. A



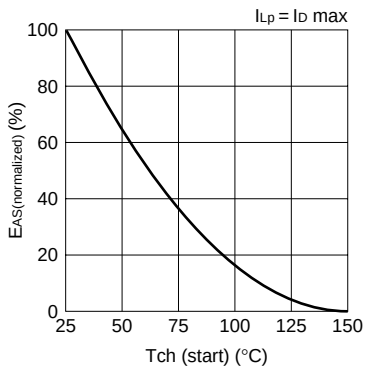
3. Temperature derating for EAS

The E_{AS} value in the specifications is guaranteed when the channel temperature T_{ch} is 25°C. Since the E_{AS} value drops as the channel temperature rises, derating depending on the temperature is necessary.

Fig. B shows the derating curve for single avalanche energy capability. This is the derating curve of E_{AS} and the channel temperature (T_{ch} (start)) immediately before the avalanche occurs in the product, with the E_{AS} value (maximum rating) at 25°C as 100%.

For example, if the product temperature is 50°C, the E_{AS} value is derated to 64% of the value at 25°C.

Fig. B



4. Continuous avalanche energy capability

This section explains the derating method for continuous avalanche.

Considering continuous avalanche as the repetition of a single avalanche, the safe operating area (SOA) is determined using the derating curve shown in Fig. B.

Calculate the energy and T_{ch} (start) of avalanche in the worst condition and determine SOA using the calculated data and the derating curve shown in Fig. B. The temperature rise due to avalanche should not cause the channel temperature to exceed the maximum rating.

The following is an example of determining SOA judgment by calculation when a MOSFET enters a transient avalanche state at power-on then changes to a stationary state

Supposing that the waveform is as shown in Fig. C until the MOSFET changes to the stationary state, calculate the start loss and switching (turn-on/off) loss. To simplify the calculation, the average loss Pa and the last two waveforms are used for approximation. (Fig. D)

First, calculate the channel temperature T_{ch} (τ) at time (τ) where the temperature condition is severest.

If the T_{ch} (τ) value is within the maximum rating, there is no problem as far as the temperature is concerned.

$$T_{ch}(\tau) = T_a + P_a \bullet r_{ch-c}(T_n + T + t_1 + t_2 + t_3)$$
$$+ (P_1 - P_a) \bullet r_{ch-c}(T + t_1 + t_2 + t_3)$$
$$- (P_1 - P_2) \bullet r_{ch-c}(T + t_2 + t_3)$$
$$+ (P_3 - P_2) \bullet r_{ch-c}(T + t_3)$$
$$- P_3 \bullet r_{ch-c}(T) + P_4 \bullet r_{ch-c}(t_4 + t_5 + t_6)$$
$$- (P_4 - P_5) \bullet r_{ch-c}(t_5 + t_6)$$
$$+ (P_6 - P_5) \bullet r_{ch-c}(t_6) \cdots\cdots ③$$

*T_a : Ambient temperature

*$r_{ch-c}(t)$: Transient thermal resistance at pulse width t

Then calculate the channel temperature $T_{ch}(\tau l)$ immediately before avalanche.

$$T_{ch}(\tau) = T_a + P_a \bullet r_{ch-c}(T_n + T' + t_1 + t_2 + t_3)$$
$$+ (P_1 - P_a) \bullet r_{ch-c}(T' + t_1 + t_2 + t_3)$$
$$- (P_1 - P_2) \bullet r_{ch-c}(T' + t_2 + t_3)$$
$$+ (P_3 - P_2) \bullet r_{ch-c}(T' + t_3)$$
$$- P_3 \bullet r_{ch-c}(T') + P_4 \bullet r_{ch-c}(t_4 + t_5 + t_6)$$
$$- (P_4 - P_5) \bullet r_{ch-c}(t_5 + t_6)$$
$$+ (P_6 - P_5) \bullet r_{ch-c}(t_6) \cdots\cdots ④$$

This $T_{ch}(\tau)$ value becomes $T_{ch}(start)$. If the avalanche energy ($E_{AS} = P_6 \bullet t_6$) is within the value derated from the guaranteed E_{AS} value at the temperature, there is no problem as far as the avalanche energy is concerned.

Fig. C

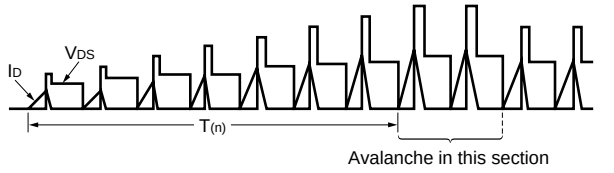


Fig. D

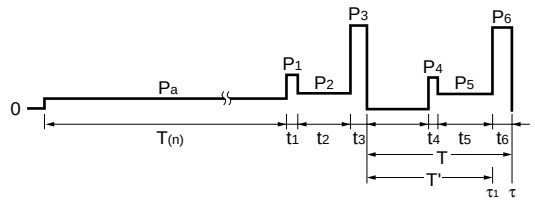
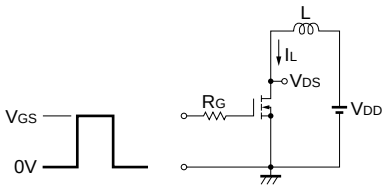


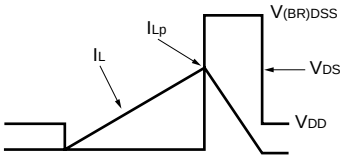
5. Avalanche energy capability measuring method

Fig. E



(a) Measuring circuit

$$E_{AS} = \frac{1}{2} \bullet L \bullet I_{Lp}^2 \bullet \frac{V_{(BR)DSS}}{V_{(BR)DSS} - V_{DD}}$$



(b) Output waveform

Transistor array with built-in avalanche diode

SLA4010, STA301A, 371A, 401A, 406A, 413A, 435A, 460C, 471A, 475A, 481A, 485A, SDC03, 04, 06

The Darlington transistor chip with a built-in avalanche diode is a planar type monolithic Darlington transistor chip having the equivalent circuit shown in the figure on the right. Surge Voltage can be absorbed by the avalanche diode provided between the collector and the base. This eliminated the need for extra components for absorbing surge caused by counter electromotive force produced by inductive load switch circuits. These Darlington transistor arrays are ideal for relay drive, solenoid drive, and printer wire drive applications.

V_{TH}	1.0		2.0	V	V_{DS}=10V, I_D=250μA
$Re_{(yfs)}$	1.5			S	V_{DS}=10V, I_D=1.0A
$R_{DS(ON)}$		0.60	0.80	Ω	V_{GS}=10V, I_D=1.0A
		0.75	0.95	Ω	V_{GS}=4V, I_D=1.0A
Ciss		160		pF	V_{DS}=25V,
Coss		40		pF	f=1.0MHz,
Crss		10		pF	V_{GS}=0V
$t_{d(on)}$		7		ns	I_D=1A, V_{DD}≒50V,
t_r		20		ns	R_L=50Ω,
$t_{d(off)}$		35		ns	V_{GS}=10V,
t_f		30		ns	see Fig. 3 on page 16.
V_{SD}		1.0	1.5	V	I_{SD}=2A, V_{GS}=0V
t_{rr}		140		ns	I_{SD}=±100mA

Characteristic curves

Sanken Electric Co., Ltd.
1-11-1 Nishi -Ikebukuro,Toshima-ku, Tokyo
PHONE: 03-3986-6164
FAX: 03-3986-8637
TELEX: 0272-2323(SANKEN J)

Overseas Sales Offices

●Asia

Sanken Electric Singapore Pte.Ltd.
150 Beach Road,#14-03 The Gateway West,
Singapore 0718
